Your guide to diabetic retinopathy screening

This leaflet explains what diabetic retinopathy is and why getting screened is important.

What screening results might I get?
If any slight changes to your eyes are found, you may be asked to return for a further appointment in 6 months’ time.

Your results may show that you need further investigation or treatment. The hospital eye clinic will contact you with an appointment.

If the quality of the photograph is not good enough, you will be asked to return for a further examination.

Your results may need further treatment or an appointment.

How can I reduce the risk of developing diabetic retinopathy?
- Control your blood glucose as effectively as possible.
- See your doctor regularly to check your blood pressure is not raised.
- Attend your diabetic retinopathy screening appointments.
- Visit your optometrist if you have a problem with your sight.
- Take your medication as prescribed.

Where can I get more information?
Your invitation letter has more details about what you need to do next. You can also find out more by visiting:

Diabetic retinopathy screening is part of managing your diabetes. Diabetic retinopathy is usually treatable, especially if caught early.

Only authorised staff and appropriate healthcare professionals have access to information about your screening results. If you need more information about NHS record-keeping, you can phone the NHS inform helpline free on 0800 22 44 88 (textphone 18001 0800 22 44 88). The helpline is open every day, please check the website for the opening hours. It also provides an interpreting service.
Why should I be screened?

If you have diabetes then screening is important because your eyes are at risk of damage from diabetic retinopathy. Screening is a key part of your diabetes care and can reduce that risk by detecting the condition early, before you notice any changes to your sight.

Untreated diabetic retinopathy is the most common cause of sight loss in people of working age. When the condition is caught early, treatment is effective at reducing or preventing damage to your sight.

How often will I be offered screening?

Screening is offered every year to anyone with diabetes aged 12 and over.

What is diabetic retinopathy?

This condition occurs when diabetes affects the small blood vessels in the retina, which is at the back of the eye. The blood vessels in the retina can leak or become blocked.

This condition may cause blindness or serious damage to your eyesight. In its early stages there are no symptoms so you may not realise that you have diabetic retinopathy.

What will happen at my screening appointment?

Photographs are taken of the back of your eyes. The camera does not come into contact with your eyes. All photographs are then carefully examined for signs of retinopathy.

Around 1 in 4 people may need to be given eye drops so that a good photograph can be taken.

The appointment will normally last approximately 10 minutes (it may take 30 minutes if eye drops are used).

Your results letter is sent to you and your GP (and your hospital diabetes clinic, if you attend one) within 4 weeks.

Bring all the glasses and contact lenses you wear with you, as well as lens solution for contacts.

Are there any side effects?

If eye drops are used, there may be some side effects:

• Your eyes may sting briefly.
• Your eyes are likely to become sensitive to bright light, so you may want to bring sunglasses to wear afterwards.
• You may experience blurred vision and it is not recommended that you drive for a few hours after the appointment. You should make alternative arrangements for getting home safely.

By law, you should not drive if you cannot read a number plate clearly from 20 metres.

Will I still need to have a regular eye test at the optometrists?

Yes, you need to do both. Your screening photographs will either be graded by a health professional or an automated grading system to detect diabetic retinopathy but not any other eye conditions. You should continue to visit your optometrist regularly for a free eye check as well.
